Claims

- 1. (Currently amended) A method of moving droplets, comprising:
- 2 providing a liquid phase on a surface;
- dispensing a droplet into the liquid phase, the liquid phase being
- 4 immiscible with the droplet; and
- 5 <u>directing focusing</u> a <u>focused</u> beam of light at an edge of <u>into</u>
- 6 <u>direct contact with an edge region of the droplet in the liquid phase</u>
- 7 <u>causing the droplet to heat and to produce</u> a thermal gradient <u>to form</u>
- 8 within the droplet sufficient to induce the droplet to move in the liquid
- 9 phase.
- 1 2. (Original) The method of claim 1, wherein the droplet forms a contact
- 2 angle approaching 180° with respect to the surface.
- 1 3. (Canceled)
- 1 4. (Canceled)
- 1 5. (Original) The method of claim 1, wherein the immiscible liquid phase
- 2 includes an organic liquid.
- 1 6. (Original) The method of claim 5, wherein the organic liquid includes
- decanol.

- 7. (Original) The method of claim 1, wherein the immiscible liquid phase controls evaporation of the droplet.
- 1 8. (Original) The method of claim 1, wherein the immiscible liquid phase
- comprises a first immiscible liquid and a second immiscible liquid, the
- second immiscible liquid having a greater density than that of the first
- 4 immiscible liquid and of the droplet to produce a fluid-to-fluid interface
- 5 between the immiscible liquids upon which the droplet sits.
- 1 9. (Original) The method of claim 8, wherein the second immiscible liquid
- 2 includes perflourinated silicone oil.
- 1 10. (Canceled)
- 1 11. (Canceled)
- 1 12. (Original) The method of claim 1, wherein the droplet is aqueous.
- 1 13. (Original) The method of claim 1, wherein the beam of light includes an
- 2 infrared wavelength.
- 1 14. (Original) The method of claim 1, further comprising inserting dye into
- one of the droplet and the immiscible liquid phase to cause optical
- 3 absorption by molecules of the dye.

- 1 15. (Original) The method of claim 1, wherein a size of the droplet ranges
- from approximately 30 μm to 1500 μm in diameter.
- 1 16. (Original) The method of claim 1, wherein the droplet is a first droplet,
- and further comprising depositing a second droplet into the immiscible
- 3 liquid phase and moving the first droplet into the second droplet to cause
- 4 the droplets to fuse and contents of the droplets to mix.
- 1 17. (Original) The method of claim 16, wherein each droplet contains a
- 2 chemical fragment.
- 1 18. (Original) The method of claim 16, further comprising detecting a
- 2 biological molecule in the fused droplet.
- 1 19. (Original) The method of claim 16, further comprising detecting a gene
- in the fused droplet.
- 1 20. (Original) The method of claim 16, further comprising detecting
- 2 products of gene expression of a particular gene.
- 1 21. (Original) The method of claim 1, further comprising turning the light
- beam on and off to perform thermal cycling of the droplet.
- 1 22. (Currently amended) An apparatus for moving droplets, comprising:
- a liquid phase on a surface;

25.

1

2

(Original)

liquid includes perflourinated silicone oil.

3		a droplet disposed in the liquid phase on the surface;
4		a light source producing a focused beam of light;
5		means for directing the <u>focused</u> beam of light at <u>into direct</u>
6		contact with an edge region of the droplet disposed in the liquid phase
7		on the surface causing the droplet to heat the droplet and cause a
8		thermal gradient to form across within the droplet sufficient to induce
9		the droplet to move across the surface within the liquid phase.
1	23.	(Currently amended) The apparatus of claim 22, further comprising a
2		liquid phase on the surface, wherein the liquid phase being is immiscible
3		with the droplet, and wherein the droplet is surrounded by the
4		immiscible liquid phase.
1	24.	(Currently amended) The apparatus of claim <u>22</u> 23 , wherein the
2		immiscible liquid phase comprises a first immiscible liquid and a second
3		immiscible liquid, the second immiscible liquid having a greater density
4		than that of the first immiscible liquid and of the droplet to produce a
5		fluid-to-fluid interface between the immiscible liquids upon which the
6		droplet sits.

The apparatus of claim 24, wherein the second immiscible

- 1 26. (Original) The apparatus of claim 23, wherein the immiscible liquid
- 2 phase includes an organic liquid.
- 1 27. (Original) The apparatus of claim 26, wherein the organic liquid
- 2 includes decanol.
- 1 28. (Original) The apparatus of claim 22, where the beam of light includes
- 2 an infrared wavelength.
- 1 29. (Original) The apparatus of claim 22, wherein the droplet is aqueous.
- 1 30. (Original) The apparatus of claim 22, wherein the droplet includes a
- 2 dye to cause optical absorption by the droplet.
- 1 31. (Original) The apparatus of claim 22, wherein a size of the droplet
- ranges from approximately 30 μm to 1500 μm in diameter.
- 1 32. (Currently amended) The apparatus of claim 22, further comprising a
- second droplet on the surface disposed in the liquid phase and wherein
- the directing means causes one of the droplets to move into the other of
- 4 the droplets, causing the droplets to fuse and contents of the droplets to
- 5 mix.
- 1 33. (Original) The apparatus of claim 32, wherein each droplet contains a
- 2 chemical fragment.

- 1 34. (Original) The apparatus of claim 32, further comprising means for detecting a biological molecule in the fused droplet.
- 1 35. (Original) The apparatus of claim 32, further comprising means for detecting a gene in the fused droplet.
- 1 36. (Currently amended) The apparatus of claim 32, further comprising
 2 means for detecting <u>produces products</u> of gene expression of a particular
 3 gene.
- 1 37. (New) The method of claim 1, wherein the surface is a surface of a
 2 substrate upon which the liquid phase is disposed, the substrate being
 3 transparent to a wavelength of the light beam so that the light beam
 4 passes through the substrate to come in direct contact with the droplet.
- 1 38. (New) The apparatus of claim 22, wherein the surface is a surface of a
 2 substrate upon which the liquid phase is disposed, the substrate being
 3 transparent to a wavelength of the light beam so that the light beam
 4 passes through the substrate to come in direct contact with the droplet.
